While conventional thin-film solar cells bend at a curvature radius of a few millimeters, organic cells outperform them in terms of flexibility. Kaltenbrunner et al. [] have reported that glueing the flexible device to a pre-stretched elastomer allows the devices to resist quasi-linear compression to below 70% of their original area.

This technological progress provides a practical basis for the commercialization of flexible, lightweight, low-cost and highly efficient solar cells, and the ability to bend or roll up...
