If the battery has been charging for a long time then the rectifiers reduce the 15V to 13.2V and the battery is only 12.5V so the resistor has $13.2V - 12.5V = 0.7V$ and the current in the 8.2 ohm resistor is $0.7V/8.2 \text{ ohms} = 85\text{mA}$. The battery voltage is so low that I think the battery has one shorted cell because 9 cells at 1.4V each make 12.6V.
