Aluminum electrolytic capacitors are (usually) polarized electrolytic capacitors whose anode electrode (+) is made of a pure aluminum foil with an etched surface. The aluminum forms a very thin insulating layer of aluminum oxide by anodization that acts as the dielectric of the capacitor. A non-solid electrolyte covers the rough surface of the oxide layer, serving in principle as the ...

Like in other components, a capacitor's ratings need to be de-rated with external conditions (e.g. temperature). This means that a capacitor's voltage rating might be lower for different temperatures. For example, an aluminium electrolytic capacitor's voltage rating will probably be lower at 80 $^{\circ}$ C than that at 20 $^{\circ}$ C..
