A microgrid is a local electrical grid with defined electrical boundaries, acting as a single and controllable entity. [1] It is able to operate in grid-connected and in island mode. [2] [3] A "stand-alone microgrid" or "isolated microgrid" only operates off-the-grid and cannot be connected to a wider electric power system. [4]Very small microgrids are called nanogrids.

If this is the case, the microgrid's solar panels will instead switch to battery storage (energy storage system). If prices rise, the microgrid controller may switch to discharging its batteries (or other distributed energy resources (DERs) rather than source power from the utility grid. This is known as peak shaving.

The optimal scheduling of microgrids with battery energy storage system (BESS), solar and/or wind generation has been studied in [3,4,5,6,7,8,9,10,11,12,13,14,15,16,17,18,19,20].
