

More stable solar energy working principle

In order to increase the PCE of solar cells, one effective way is to use low bandgap materials to absorb lower energy photons for the generation of more e-h pairs because approximately 50% of the radiant energy from the sun is in the infrared range (>760 nm); another way is to reduce the recombination of photogenerated e-h pairs, caused by ...

The working principle of solar PV (SPV) cells is based on the PV or photoelectric effect for semiconductor materials. These formulate that, in certain circumstances, an electron (e^-) of a semiconductor material can absorb an energy packet known as photon. The energy content possessed in the photon is given by the following equation: (1.1) $E = h\nu$...
