

The battery size, or battery capacity, is measured in kWh. The e-Golf was originally released with a 24.2 kWh battery, which was upgraded to 35.8 kWh in 2017 models. These are pretty small batteries, but the e-Golf's efficiency means that the small capacities can carry the car for a decent range. What is the battery warranty for a new or used e ...

It takes less energy to warm the battery from -5C/20F to 5C/40F than to cool from 30c/90F down to 20C/70F (based on my anecdotal observations). So battery health is most likely not affected by cold temperatures but it's range effectiveness is most probably as a result of tire energy efficiency and lack of regen braking.

In winter conditions, the use of the heating system inside the vehicle also impacts the range of your electric car. Fortunately, there are smart solutions for limiting energy consumption in your electric vehicle, despite the cold weather, and it is even possible to improve the performance of your car during the winter. Battery range: small ...

EV range decreases under cold temperature due to several reasons: the energy consumption of the cabin heating system, a deterioration in battery performance and a reduction in powertrain system efficiency. Among ...

Riders can experience up to 20% to 30% drop in range in freezing conditions! If you rely on your e-bike, this can be extremely frustrating. In addition to reduced range, charging an e-bike battery in cold temperatures takes longer. The battery's ability to absorb energy is affected, leading to slower charging times.

Chinese solid-state battery startup Talent New Energy has unveiled a new all-solid-state battery cell with ultra-high energy density, as the industry's quest for new battery technology continues to advance. Join us on ...

Make no mistake: electric cars are less efficient in the winter. The cold weather affects battery performance, reducing range and forcing you to charge more often. But with EVs accounting for 14.5 ...

80mph highway driving will give you significantly less than the rated economy and range, summer or winter. You can see a prediction of your range based on your actual recent consumption on the energy screen. This is distinct from the miles shown next to the battery icon, which shows rated range. Winter driving tends to have these kinds of ...

The 0°C cell has higher internal resistance - more energy is wasted as heat and is not available to move the car. We get more voltage sag and less range. The same thing happens during charging - it's a bit slower in the winter because some of the energy from the charger is converted to heat. The effect tapers off as the cell warms and internal ...

With all of that said, Recurrent's new study for 2022 highlights real-world cold-weather and winter-driving data from 7,000 vehicles and tens of thousands of various data points within its community.

BMW i4 range. The new entry-level i4 eDrive35 features a 70kWh battery and offers up to 299 miles of range, according to BMW. A range figure of around 250 miles should be more than doable on a day-to-day basis, which therefore makes the base i4 the sweet spot for the majority of EV drivers. Over the past year, Consumer Reports sought to answer this question by conducting seasonal testing on popular, new EVs: Ford Mustang Mach-E, Hyundai Ioniq 5, Tesla Model Y, and Volkswagen ID.4.

Porsche says that the combination of new anode chemistry and dense packaging could unlock range of over 800 miles - a 30 to 50 percent increase over the longest-range EV batteries today. More importantly, those same innovations will unlock improved fast-charging capability that would one day mean charging to 80 percent of a vehicle''s range would only take as long as stopping ...

Scientists are racing to perfect new battery chemistries that don't lose as much energy in cold weather as today's lithium-ion systems. Also, cars equipped with efficient heat pumps don't lose as much range in the cold.

At 8:30, thirty minutes into my drive, outside temp had climbed to 18F, battery was up to 49F and motor temps were 267-280F. At 8:48, on arrival at Stratton, outside temp was 21F, battery was 59F and motor temps had dropped to 129-140F. The car reported 72% range remaining, so I used approximately a quarter of my car's range to drive 33 miles.

My 2011 routinely drops into the low 20"s for range in the NJ winter time. 21 miles was not out of the question. Last night the temp was around 40 and we took it out to a restaurant, and although I didn"t run the battery out completely it looks like it would have rang in around 26 miles. Yes, I use the heater. I preconditioned before leaving ...

With ranges 200+ miles now it really isn't that big of a deal. I'm getting 150+ miles in the winter in my Bolt. I don't even think twice about turning on the heat (although I still precondition it in the morning when its still plugged in). As batteries get larger and larger the % consumed due to the heater in the winter will be lower.
