

Battery powered electric vehicle technologies are advancing in the present world for minimizing the global warming effects. The electric vehicle concept comes as alternate to internal combustion engine vehicles that uses electric energy from electric energy storage systems of high-energy capacity and long-life cycle. Lithium-ion (Li-Ion) batteries are ...

This paper proposes a balanced energy path optimization based on the whale optimization algorithm [7, 8], the path optimization model is established based on the battery state of charge to maximize energy utilization and minimize the distance.Fuzzy logic control algorithm (FLC) [9,10,11,12] is an intelligent control strategy based on language ...

Corrective equalization entails charging the battery bank with a very high voltage, much higher than the typical operation or even routine equalization. Also Read: What are Energy Levels? The battery bank will heat up and must be constantly monitored to ensure it does not exceed the safe operating temperature. This could cause ...

25 Passive equalization is straightforward and quick to operate, but because of its inefficient equalization, energy is not fully utilized and may be wasted. 1,26 Active equalization is more ...

The relevant research has focused on the design of equalization circuits and the improvement of equalizer efficiency while neglecting a comparative analysis of ...

Equalization is complete when specific gravity values no longer rise during the gassing stage; Battery voltage during an equalization charge should be allowed to rise to 2.65V per cell +/- .05V (8V on a 6-volt battery and 16 volts on a 12V battery) NOTE: Many chargers do not have an equalization setting, so this procedure can"t be carried out.

Active equalization was better than passive equalization in reducing battery capacity differences. The maximum difference in state of charges among batteries with active equalization at a current rate of 0.25 C decreased from 10% to 9.207% in discharging, while that with passive equalization dropped from 10% to 9.492%.

The equalization technique is essential to eliminate the influence of more discrete voltage, internal resistance, and capacity to ensure the available capacity and safety of the battery pack. The ...

The simulation and experimental results show that the proposed QRZCS battery equalization schemes can achieve bidirectional battery equalization performance and reduce the MOSFET transistor switch ...

Equalization charges the battery at a higher voltage than normal, helping to break down the lead sulfate

crystals and restore capacity. If you have a lead-acid battery, it's important to equalize it every few months to keep it in good condition. Many modern battery chargers have an equalization mode, so it's easy to do.

Abstract. With the rapid development of new energy vehicles, a large number of lithium batteries have been produced, used, and then retired. The full utilization and safe use of the whole life cycle of the batteries have become a hot topic in the research field. Compared to brand-new batteries, retired power batteries exhibit significant ...

: The output voltage of the jth battery group (the input voltage of the jth DC/DC converter). (8) V cj: The output voltage of the jth DC/DC converter. (9) V out: The output voltage of the battery ...

The cells within the module are equalized according to the principle of the conventional resonant SC equalizer. In addition, the module-to-module equalization ...

Nowadays, Lithium-based batteries are becoming the research focus in the area of electric vehicle design because of their high terminal voltage, large energy density and lack of memory effect [1,2,3]. To meet the requirements of high voltage and power, they were commonly connected in a string []. Due to the manufacturing variances, internal ...

Lithium batteries have become the main power source for new energy vehicles due to their high energy density and low self-discharge rate. In actual use of series battery packs, due to battery internal resistance, self-discharge rate and other factors, inconsistencies between the individual cells inevitably exist.

2.1.3 Comparisons of Cell Equalization Systems. The specific advantages and disadvantages of the two equalization circuit topologies are compared. The results show that the passive equalization system has the advantages of simple structure, low cost, stability and reliability; it's disadvantages are slow equalization speed and high energy ...

The equalization technique is a key technique in the secondary utilization of retired batteries. In this paper, a double-layer equalization method is proposed, which combines the reconfigurable topology with the converter active equalization method. The inner layer uses the reconfigurable topology to have a balanced set of battery cells. ...

The equalization method based on the switched capacitor proposed in refs. [14-18] has simple control and low cost, but the equalization speed is limited, especially when the voltage difference ...

A New Equalization Method for Lithium-Ion Battery Packs Based on CUK Converter ... Aiming at the traditional CUK equalizer can only perform energy equalization between adjacent batteries, if the ...

The series of energy storage devices, namely battery, super/ultra-capacitor string voltage balancing circuit,

based on a single LC energy converter, is presented in this paper.

It can achieve the battery voltage equalization by transferring the energy between two adjacent cells. When the number of batteries to be balanced is large, such as 7104 cells in series for Tesla"s electric car, it will take a long time and many steps to equalize the cell voltage and result in the low balancing efficiency and balancing speed ...

Voltage equalization control algorithm for monitoring and balancing of series connected lithium-ion battery M. M. Hoque. 0000-0001-9182-4010 ; M. M. Hoque a) 1 Department of Electrical ... A new battery/ultracapacitor hybrid energy storage system for electric, hybrid, and plug-in hybrid electric vehicles ...

In Koseoglou et.al (2020) presented a very effective approach for voltage-based cell equalization in Li-ion battery packs. This study found that by altering the gate-source voltage of the MOSFET, the charging current of each cell within a module could be successfully regulated (a process guided by a FL voltage cell equalization controller).

Equalization charges the battery at a higher voltage than normal, helping to break down the lead sulfate crystals and restore capacity. If you have a lead-acid battery, it's important to equalize it every few months to keep ...

Equalization strategies can be further subdivided into voltage, SoC and remaining-capacity-based according to equalization reference. Voltage-based equalization strategies operate with the target of voltage uniformity. Fuzzy logic control strategy [31] applied in transformer-based equalizers considers voltage as reference. Battery cell ...

Request PDF | On Aug 29, 2019, Lingjun Song and others published Lithium-ion battery pack equalization based on charging voltage curves | Find, read and cite all the research you need on ResearchGate

In this paper, we propose a high-performance equalization control strategy based on the equalization data of the general equalization strategy, which turns on the equalization again after the equalization is completed and uses the ...

The equalization method based on the switched capacitor proposed in refs. [14-18] has simple control and low cost, but the equalization speed is limited, especially when the voltage difference between the batteries is small. The inductance-based equalization method proposed in [19-23] has a faster equalization speed because ...

On the other hand, terminal voltage equalization is not applicable for batteries having a flat SOC-open-circuit voltage curve. This paper introduces the framework to calculate the RAE of a battery pack incorporating the variation of internal resistance and capacity of the individual cells in a pack.

1. Introduction. Lithium-ion batteries are widely used as the primary energy source in new energy vehicles and energy storage stations due to their high energy density, good discharge performance, low self-discharge rate, and long cycle life [[1], [2], [3]]. The battery packs of new energy vehicles consist of thousands of batteries connected in series or ...

Stationary batteries are almost exclusively lead acid and some maintenance is required, one of which is equalizing charge. Applying a periodic equalizing charge brings all cells to similar levels by increasing the voltage to 2.50V/cell, or 10 percent higher than the recommended charge voltage.

With the development and popularity of Lithium battery powered PEVs (Pure Electric Vehicles), BMS (Battery Management System) with equalization techniques become a key issue in high performance PEV design. This paper introduces a linear regression based real-time State of Charge calculation method through a second-order ...

This paper proposes a layered bidirectional equalizer based on a novel resonant voltage balance converter, which can be widely used in the fields of energy storage system battery equalization, ...

The experimental results show that under static equalization, the voltage reaches equalization in about 25 min and the equalization efficiency reaches 96.64%, which greatly reduces the switching ...
