o AC internal resistance, or AC-IR, is a small signal AC stimulus method that measures the cell's internal resistance at a specific frequency, traditionally 1 kHz. For lithium ion cells, a second, low frequency test point may be used to get a more complete picture of the cell's internal resistance.

The higher the internal resistance the less current the battery is capable to provide. The higher the internal resistance the more the battery will heat up on the same current output. Internal resistance measurements are also useful for evaluating whether a battery can deliver its stored energy effectively. In general, a battery with low internal resistance is better able to deliver high current on demand. High ...

New energy battery internal resistance test

The internal resistance of a voltage source (e.g., a battery) is the resistance offered by the electrolytes and electrodes of the battery to the flow of current through the source.. The internal resistance of a new battery is usually low; however, as the battery is put to more and more use, its internal resistance increases.
