The design of the collector was made to maximize the heat transfer and thermal energy utilization. Double pass solar air collectors allow for air to flow above and below the absorber plate and is proven to produce a higher rise in air temperature than its single-pass counterpart; this is mainly attributed to doubling the area of heat transfer ...

Easy freezing and overheating of the flat panel solar collector (FPSC) limits its large-scale application. In addition to the characteristics of high heat storage density and low price, inorganic supercooling phase change materials (PCMs) also have a large difference between their melting and freezing points, which fully meets the needs of FPSCs.
