

New material super battery

At DTU, researcher Mohamad Khoshkalam has invented a material that has the potential to replace lithium in tomorrow's super battery: solid-state batteries based on potassium and sodium silicates.

Future electric vehicles could run on "super batteries" made of rocks, according to researchers.. The new technology would allow for solid state batteries that are not only more efficient than today's batteries, but more environmentally friendly and safe, too.. That is according to scientists at the Technical University of Denmark who have invented a new technology that ...
