A lead-acid battery cannot remain at the peak voltage for more than 48 h or it will sustain damage. The voltage must be lowered to typically between 2.25 and 2.27 V. A common way to keep lead-acid battery charged is to apply a so-called float charge to 2.15 V.

When the value of internal resistance is low, the battery is able to carry a significant amount of current. On the other hand, a battery with high internal resistance can only carry a small amount of current. Fig.1 shows an example of the internal configuration of a battery. Ideally, a battery's internal resistance should be zero, allowing for ...
