Simple Steps: Rejuvenating a lead-acid battery involves straightforward processes like cleaning the cells, checking voltage, and fully charging and discharging the battery. Proper Techniques : While using a lead-acid charger for lithium batteries isn't safe, methods like desulfation or additives can effectively restore lead-acid batteries.

Capacity. A battery's capacity measures how much energy can be stored (and eventually discharged) by the battery. While capacity numbers vary between battery models and manufacturers, lithium-ion battery technology has been well-proven to have a significantly higher energy density than lead acid batteries.

The lifespan of a lead-acid battery can vary depending on the quality of the battery and its usage. Generally, a well-maintained lead-acid battery can last between 3 to 5 years. However, factors such as temperature, depth of discharge, and charging habits can all affect the lifespan of the battery.

Brief history of lead-acid Battery. The lead-acid battery is a type of rechargeable battery which was invented in 1859 by French physicist Gaston Planté was the first type of rechargeable battery ever created.
