Analysis and design of an inverter-based current comparator consisting of 3 cascaded inverters is presented. Ideally, the comparator has almost zero input offset current when all inverters are assumed to be identical. In practice, small amount of threshold voltage or current mismatches may cause the offset current to increase dramatically. A switched ...

In This paper, we presents a full on-chip and area efficient low-dropout voltage regulator (LDO) which, exploiting the technique nested miller compensation with active capacitor (NMCAC) to eliminate the external capacitor without compromising the stability of the system in the full output current range. The external capacitor is removed allowing for ...
