these parasitic parameters can be calculated from measured net-work parameters based on the network theory, as will be shown in this paper. Scattering parameters (-parameters) are chosen to charac-terize EMI filters [11] and to extract mutual couplings because of two reasons. First, in the HF range, they are easier to ac-curately measure than it is to do so for the,,, and ...

Specifically, six different coupling effects are investigated: the couplings between the inductor and capacitors, a filter inductor and trace loops, two filter inductors, two capacitor parasitic inductances, a filter inductor and ground plane, and two trace loops. Experiments were performed, theories were developed to investigate and characterize these parasitic couplings.

The three parameters Ciss, Coss, Crss appearing on MOSFET data sheets in general relate to these parasitic capacitances. On data sheets which provide separate descriptions of static characteristics and dynamic characteristics, these are classified as dynamic characteristics. These are important parameters affecting switching performance.
