Abstract A unique substance or material that releases or absorbs enough energy during a phase shift is known as a phase change material (PCM). Usually, one of the first two fundamental states of matter--solid or liquid--will change into the other. Phase change materials for thermal energy storage (TES) have excellent capability for providing thermal ...

1. Introduction The concept of storing thermal energy for a long time in different applications, such as balancing building energy demand during a day or a season, can be effectively implemented using different storage media such as phase change materials (PCMs).

They can significantly improve the energy storage efficiency of solar energy storage devices and reduce costs, so they can be widely used in the field of solar energy storage. Adding MEPCM capsules to building materials such as wall panels, ceilings, and bricks can absorb solar energy during the day and release it at night to maintain stability at room temperature.
