Although TiNb 2 O 7 (TNO) with comparable operating potential and ideal theoretical capacity is considered to be the most ideal replacement for negative Li 4 Ti 5 O 12 (LTO), the low ionic and electronic conductivity still limit its practical application as satisfactory anode for lithium-ion batteries (LIBs) with high-power density. Herein, TNO ...

The new battery, on the other hand, can be both charged and discharged at ultra-low temperature. This work--a collaboration between the labs of UC San Diego nanoengineering professors Ping Liu, Zheng Chen and Tod Pascal--presents a new approach to improving the performance of lithium metal batteries at ultra-low temperature.

A lithium-ion or Li-ion battery is a type of rechargeable battery that uses the reversible intercalation of Li + ions into electronically conducting solids to store energy. In comparison with other commercial rechargeable batteries, Li-ion batteries are characterized by higher specific energy, higher energy density, higher energy efficiency, a longer cycle life, and a ...
