The most important resource for lithium-ion batteries, lithium or lithium metal oxides  $\text{LiMO}_2$  (i.e.  $\text{LiNi}_x\text{Mn}_y\text{Co}_z\text{O}_2$ ), is very common, but its extraction is extremely costly and requires a combination of chemical processes and separation processes that are very energy intensive. Graphite is also widely available, and its ...

Herein, we report a facile concentrated solar radiation strategy for the direct recycling of Lithium- and manganese-rich cathodes, which enables the recovery ...

Spinel  $\text{LiMn}_2\text{O}_4$ , whose electrochemical activity was first reported by Prof. John B. Goodenough's group at Oxford in 1983, is an important cathode material for lithium-ion batteries that has attracted continuous academic and industrial interest is cheap and environmentally friendly, and has excellent rate performance with 3D Li + ...

Lithium-rich manganese-based layered oxides (LMLOs) are considered to be one type of the most promising materials for next-generation cathodes of lithium batteries due to their distinctive ...

Targeting high-energy-density batteries, lithium-rich manganese oxide (LMO), with its merits of high working voltage (~4.8 V vs Li/Li+) and high capacity (~250 mAh g<sup>-1</sup>), was considered a promising cathode for a 500 Wh kg<sup>-1</sup> project. However, the practical application of LMO was hindered by the parasitic reaction between the ...

The development of cathode materials with high specific capacity is the key to obtaining high-performance lithium-ion batteries, which are crucial for the efficient utilization of clean energy and the realization of carbon neutralization goals. Li-rich Mn-based cathode materials (LRM) exhibit high specific capacity because of both cationic ...

$\text{Li}(\text{Ni}_{0.8}\text{Co}_{0.1}\text{Mn}_{0.1})\text{O}_2$  (NCM811) was synthesized using alkali chlorides as a flux and the performance as a cathode material for lithium ion batteries was examined. Primary particles of the powder were segregated and grown separately in the presence of liquid state fluxes, which induced each particle to be composed of one ...

It is used in the composition of LMO (Lithium Manganese Oxide) cathodes up to 65 % by mass, as well as NMC (Nickel Manganese Cobalt Oxide) cathodes with the chemical formula  $\text{Li}(\text{NiMnCo})\text{O}_2$ , containing between 6 % and 19 % manganese by mass depending on the configuration chosen [137]. This technology is experiencing ...

The proposed lithium manganese oxide-hydrogen battery shows a discharge potential of ~1.3 V, a remarkable rate of 50 C with Coulombic efficiency of ~99.8%, and a robust cycle life. A systematic electrochemical study demonstrates the significance of the electrocatalytic hydrogen gas anode and reveals the charge storage ...

Li-ion battery (LIBs) technology was first commercialized by Sony Corporation of Japan in 1991. They were named due to the exchange of lithium ions ( $\text{Li}^+$ ) between the anode and cathode in the electrochemical cell [9, 10]. The main uses of LIBs are electric vehicles, electric bicycles, hybrid electric vehicles, and industrial energy storage ...

The development of society challenges the limit of lithium-ion batteries (LIBs) in terms of energy density and safety. Lithium-rich manganese oxide (LRMO) is regarded as one of the most promising ...

This review analyzed the literature data about the global warming potential (GWP) of the lithium-ion battery (LIB) lifecycle, e.g., raw material mining, production, use, and end of life. The literature data were associated with three macro-areas--Asia, Europe, and the USA--considering common LIBs (nickel manganese cobalt (NMC) and lithium iron ...

1. Introduction. Since the commercialization of lithium-ion batteries (LIBs) in 1991, they have been quickly emerged as the most promising electrochemical energy storage devices owing to their high energy density and long cycling life [1]. With the development of advanced portable devices and transportation (electric vehicles (EVs) ...

Lithium Manganese Oxide (LMO) Batteries. Lithium manganese oxide (LMO) batteries are a type of battery that uses MnO<sub>2</sub> as a cathode material and show diverse crystallographic structures such ...

All-solid-state lithium batteries (ASSBs) with high energy density and intrinsic safety have received increasing attention, and their performance largely depends ...

Several studies on the life cycle assessment (LCA) of lithium-ion battery recycling have focused on discussing the state of the art of recycling process technologies such as pyrometallurgical ...

The increasing demand for portable electronics, electric vehicles and energy storage devices has spurred enormous research efforts to develop high-energy-density advanced lithium-ion batteries (LIBs). Lithium-rich manganese oxide (LRMO) is considered as one of the most promising cathode materials because of its high specific ...

Lithium-rich manganese-based layered oxide cathode materials (LLOs) have always been considered as the most promising cathode materials for achieving high energy density lithium-ion ...

LiMn<sub>2</sub>O<sub>4</sub> is a promising candidate for a cathode material in lithium ion batteries (LIBs) due to its ability to intercalate lithium ions reversibly through its three-dimensional manganese oxide network.

Abstract. Spinel LiMn<sub>2</sub>O<sub>4</sub>, whose electrochemical activity was first reported by Prof. John B. Goodenough's group at Oxford in 1983, is an important cathode material for lithium-ion batteries that has ...

Lithium manganese oxide is regarded as a capable cathode material for lithium-ion batteries, but it suffers from relative low conductivity, manganese dissolution in electrolyte and structural distortion from cubic to tetragonal during elevated temperature tests. This review covers a comprehensive study about the main directions taken into consideration ...

Introduction Lithium-ion batteries Lithium-ion batteries (LiB) are a source of electrical power. The cathode and anode of an LiB cell are separated by a membrane, which is porous enough to allow ...

1. Introduction. Lithium-ion batteries (LIBs) using Lithium Cobalt oxide, specifically, Lithium Nickel-Manganese-Cobalt (NMC) oxide and Lithium Nickel-Cobalt-Aluminium (NCA) oxide, still dominate the electrical vehicle (EV) battery industry with an increasing market share of nearly 96% in 2019, see Figure 1. The same could be stated ...

Usually, manganese is used in combination with lithium in a range of batteries such as lithium manganese oxide (LMO) batteries, lithium iron manganese phosphate batteries ( $\text{LiFeMnPO}_4$ ) and lithium ...
