If the reading is significantly lower than the rated value, the capacitor may be faulty and should be replaced. Replacing Capacitors: Purchase Replacement Capacitors: * Make sure to purchase replacement capacitors that match the specifications of the old ones. Match the capacitance (µF), voltage rating, and whether it's a start or run capacitor.

Compare the gathered readings with those printed on the capacitor label. If the numbers that you collected are roughly the same (within 0.4 microfarads) then the capacitor doesn't need to be replaced. If the difference is larger than 0.4 microfarads, then it's time to replace the capacitor.
