Green hydrogen faces barriers that prevent its full contribution to the energy transformation. Barriers include those that apply to all shades of hydrogen, such as the lack of dedicated infrastructure (e.g. transport and storage infrastructure), and those mainly related to the production stage of electrolysis, faced only by green hydrogen (e.g. energy losses, lack of ...

Although more than 99% of the Li-ion devices used for EV energy storage never exhibit problems, safety is an impediment to mass-market adoption. Li-ion batteries are more sensitive to overheating, overcharging, and thermal runaway than the nickel-metal hydride technology found in conventional gasoline-powered vehicles.
