

Select capacitors for power distribution

Experienced engineers often use general guidelines about bulk capacitance to select the capacitor values. One such guideline says to use at least 1 to 4mF of capacitance for each Watt of motor power. For example, a motor which draws 10 Amps from a 12V supply has a power of 120 Watts, leading to bulk capacitance of 120 to 480mF, using this general guideline. We dig a ...

Figure 2 - Pole-mounted capacitors. (a) Primary and (b) secondary. Capacitors are mounted on crossarms or platforms (see Figure 2) and are protected with lightning arresters and cutouts, the same as transformers. Figure 3 illustrates the many uses that are made of capacitors. How capacitors are used

You can improve power factor by adding power factor correction capacitors to your plant distribution system. When apparent power (kVA) is greater than working power (kW), the utility must supply the excess reactive current plus the working current. Power capacitors act as reactive current generators. (See Figure 6.) By providing the ...

$S(h)$ is the total apparent power of all non-linear loads in your network (kVA). $S(n)$ is the apparent power of installed transformer (kVA). $N(LL)$ is the percentage of non-linear loads in your network. If $N(LL) < 15\%$ we normally recommend a standard PFC capacitor bank. If $15\% < N(LL) < 25\%$ you may want to consider a heavy duty PFC capacitor bank.
