The relevance of ESL to capacitor selection is primarily its effect on AC response. As the lumped model suggests, real-world capacitors behave like series-connected LCR circuits. As the frequency of an applied AC voltage increases, the inductive reactance of the ESL increases to a point at which it is equal to the capacitive reactance of the ...

Quantity Implementation. The Subcircuit Capacitor model has a quantity parameter, QTY, which specifies the number of capacitors in parallel nfiguring the capacitor as a number of capacitors in parallel minimizes the number of reactive circuit elements in the model and, therefore provides a maximum simulation speed.
