Connection between internal batteries and external terminals of the battery pack is controlled by semiconductor switching devices, rather than by switches with mechanical contacts. When the battery pack is not connected, battery short circuits are prevented by non-conduction of the switching devices. When the battery pack is attached to electrical ...

This paper describes a protection circuit based on the STM32F103 processor used for a power lithium battery pack. The protection circuits from overcharge voltage and current and short circuiting of the battery pack are built into the system and include data collection, an equilibrium module, and switching protection.

This function helps to protect the battery pack. Let's take a deeper look at how the protection board functions when there is overcharging, over-discharging, or a short circuit. Overcharge Protection. The battery pack will experience normal charging when connected to the charger. As the voltage rises, the IC will monitor to see if the ...
