So this 2D/3D/2D structure has electric properties that sit between conductivity and nonconductivity --- ideal for energy storage. The new design's energy density is 19 times higher than ferroelectric capacitors. It also has a higher efficiency --- over 90%. A tiny gap in the material structure allows the capacitor to store energy. "We found ...

It depends also on design. For example, if there are two chips in the same place (one on the TOP and other on the BOTTOM), the only way is to place decoupling capacitors around the chips. If all the memory chips are for example only on the top, you may place capacitors on the bottom, however it may be then difficult to route the memory chips ...

Tip 5: Place some capacitors close to power pins Place at least one bigger (10uF) and one smaller (100nF) capacitor close to the power pins (if input), place at least one small capacitor (100nF) if the power pin is output. For hot plug power output pins (e.g. USB) use much bigger capacitance (at least 100uF or 220uF).
