When the laptop is connected to the AC mains power supply, the voltage presented by that unit is provided to both the internal switching power supplies AND the internal battery charger unit. The battery will have FET switches or at minimum be diode isolated on the output so that a laptop running on it's AC power supply IS NOT connected to the battery at all.

Analogous to the brain, smart batteries can make different corresponding regulations after being stimulated by their internal and external environments. Classified based on the intelligent features of functions, smart batteries can be divided into three generations, involving real-time perception, dynamic response, and self-decision-making..
