Solar panels output more than their nominal voltage. For example, a 12v solar panel might put out up to 19 volts. While a 12v battery can take up to 14 or 15 volts when charging, 19 volts is simply too much and could lead to damage from overcharging. Solar charge controllers aren't an optional component that delivers increased efficiency.

The efficiency of a solar panel is defined as the power that a solar panel will be able to generate from the light power supplied to it: $\text{Efficiency} = \frac{\text{electric power generated by the solar panel [W/m}^2\text{]}}{\text{incident light power [W/m}^2\text{]}}$ Since this is a ratio of power fluxes and we are dividing Watts/m² by Watts/m², the efficiency has no unit.
