The conversion of solar radiation into heat and electricity is at the heart of any transition to sustainable energy systems. The extremely high temperature in the core (15 10<sup>6</sup> K) drops to 5900 K at the outer surface. In fine, all this power is evacuated outside essentially in the form of electromagnetic radiation (light) by this peripheral surface whose temperature is 5900 K ...

Solar energy is by far the most plentiful renewable source of energy, delivered to the surface of the earth at a rate of 120,000 Terawatts (TW), compared to the global human use of 15 TW. To put this in perspective, covering 100,000 km<sup>2</sup> of desert with 10% efficient solar cells would produce 0.29 TW of power, about 12% of the global human demand for electricity.
