At 85°C, you can cram around 10kWh of solar energy into an average sized water heater. At PG& E power prices, that's worth about \$5/day. A thermostatic mixing valve is used to bring the water down to a safe temperature before use. Because this is a DC system, not connected to the grid, few or no permits are required.

Mixing valves . Thermostatic mixing valves (TMVs) are essential because solar thermal systems can heat water to surprisingly high temperatures and risk scalding your family. Make the investment in a good, reliable model of valve. TMVs work by taking in water at two ports - hot and cold - and sending the mix out through a third.

In the sand bed manifold (8 pex loops) I never want more than 140 degrees. So the supply line from the roof needs a thermostatic mixing valve that will handle the max temp the panels will ever generate, and mix it down to 180 degrees max using return water for the cooling. I'm having a hard time finding the 1-1/4" mixing valve for this job.

Mixing valves provide the following benefits for solar water heating systems: The temperature of the water is directly discharged from a solar water heater of 10C or more may vary. This may be due to the tolerance of the input control devices, temperature changes and stacking water (higher water temperatures at the top of the ...

A key factor of whether or not to consider solar power for an application relates to available energy and consumption. Two examples would be a 36-inch valve or gate operating at 1,000 psi on a crude oil pipeline and a 96-inch sluice gate in 25 feet of head water at a remote dam site.

The recirculation loop, linked to a solar tank, leads to performance improvement with 6-15% increase in energy savings following solar oversizing and ...

Thermostatic Mixing Valves combine hot and cold water to keep shower and bath output temperatures consistent and safe, preventing scorching. The temperature at the faucet is lowered by a mixing valve, making it safer for your family to use the sink, shower, or tub. Mixing Valves are an essential part of the pipeline system.

Check valves prevent the backward flow of the heated water, while mixing valves mix hot and cold water to reach the desired temperature. If you have a standard electric or gas tank, there are a number of things we can do to increase the amount of deliverable hot water from the simple to the complex. One of the ways to do that would be to simply increase the set-point of the thermostat so that the water stored in the tank would be hotter and would therefore go farther. For example, ...
