The basic components of these two configurations ...

They may be able to install a 4.5 kWp solar panel system at a cost of around £7,100. Based on a system this size, the solar panels would be expected to generate 2,850 kWh of electricity a year, equivalent to boiling a kettle 26,000 times. The two the occupants would be expected to use 35% of this electricity and export the remaining 65%.

Using a solar panel system to power the heat pump, you can lower both your electricity and your heating bills. The most common type of heat pump are air source heat pumps, which cost around £14,000 to install.

PV system efficiency. The efficiency that PV cells convert sunlight to electricity varies by the type of semiconductor material and PV cell technology. The efficiency of commercially available PV panels averaged less than 10% in the mid-1980s, increased to around 15% by 2015, and is now approaching 25% for state-of-the art modules.
