

Solar thermal power generation has disadvantages

Solar thermal energy, commonly referred to as concentrated solar power (CSP), is generated through the use of collectors. The types of collectors include a parabolic dish, trough, and heliostats. Conventional CSP systems function by concentrating sunlight into a small receiver, where it is then converted to heat by an absorber.

Solar power has even become the fastest growing energy generation source. Many new small-scale and large-scale solar projects are planned in the upcoming years, to such extent that Global Market Outlook scenarios predict that global solar power capacity could triple by the end of 2022, reaching up to 1,200 GW [2].. Despite such a successful growth and ...

Concentrated solar power (also known as concentrating solar power or concentrating solar-thermal power) works in a similar way conceptually. CSP technology produces electricity by concentrating and harnessing solar thermal energy using mirrors. At a CSP installation, mirrors reflect the sun to a receiver that collects and stores the heat energy.

Similarly, the solar thermal energy systems can be easily integrated with existing process industries to supply heat to either water pre-heating/steam generation. The solar thermal system can be integrated with the central steam/hot water supply system of the process industry (Fig. 2).
