Electrolytic capacitors and tantalum capacitors are both types of capacitors commonly used in electronic circuits. However, they differ in terms of construction, performance, and applications. Electrolytic capacitors are polarized capacitors that use an electrolyte as one of their plates, allowing them to store large amounts of charge.

Construction and properties of tantalum capacitors. Tantalum electrolytic capacitors, just like other electrolytic capacitors, are consisted of an anode, some electrolyte and a cathode. The anode is isolated from the cathode so only a very small leakage DC current may flow through the capacitor. The anode is made of pure tantalum metal.
