AC capacitor replacement cost will vary ...

Not really, electrolytic capacitors are broken down because they are not protected in many cases. In addition, the withstand voltage and power consumption of the components should be considered, try to leave margin as much as possible, such as the withstand voltage of the electrolytic capacitor. Although the peak voltage is only $220V \times 1.4 = \dots$

When a capacitor bank unit breaks down, remaining capacitors in the same parallel group hold some amount of charge. Charge will disappear in a form of a high frequency transient current that goes through the broken down capacitor unit and its fuse. The fuse holder and the broken down capacitor unit should resist this discharge transient.

0 parallelplate Q A C $|V|$ d e == ? (5.2.4) Note that C depends only on the geometric factors A and d . The capacitance C increases linearly with the area A since for a given potential difference ΔV , a bigger plate can hold more charge. On the other hand, C is inversely proportional to d , the distance of separation because the smaller the value of d , the smaller the potential difference ...
