In contrast to these PTES concepts, the Compressed Heat Energy STorage (CHEST) concept presented in this paper is based on a medium temperature conventional Rankine cycle combined with a latent heat storage unit according to the current state of the art. This concept attains an efficiency of 70% while the maximum temperature is below 400 °C.

Energy storage makes a critical contribution to the energy security of current energy networks. Today, much energy is stored in the form of raw or refined hydrocarbons, whether as coal heaps or oil and gas reserves. Since energy storage is far more efficient, power precursors are stored instead of electricity, and demand for generation varies.
