Large capacitor banks at medium-voltage levels are finding applications and greater acceptability in industrial distribution systems. However, these can give rise to current and voltage transients, stress the switching devices and insulation systems, and can be detrimental to the sensitive loads, i.e., drive systems. The paper discusses the methodology of the analysis ...

comes at a price, as the switching of power field-effect transistors in the SMPS causes it to be a major source of EMI. As shown in Figure 4, the nature of switching in the SMPS leads to discontinuous input currents, fast edge rates on switching nodes and additional ringing along switching edges caused by parasitic inductances in the power loop.

Power Integrations, Inc. announced that its CAPZero(TM) family of innovative, two-terminal, automatic X-capacitor discharge ICs has been certified to meet IEC 62368, the new over-arching safety standard covering TVs and IT equipment.
