Electrical energy storage systems include supercapacitor energy storage systems (SES), superconducting magnetic energy storage systems (SMES), and thermal energy storage systems []. Energy storage, on the other hand, can assist in managing peak demand by storing extra energy during off-peak hours and releasing it during periods of high demand [7].

Lithium metal has been considered as one of most promising anode materials owing to the ultrahigh theoretical specific capacity (3860 mAh g⁻¹) and the lowest redox potential (-3.04 V vs. standard hydrogen electrode, SHE) [32, 33] While lithium metal is used as the anode, lithium dendrite becomes an intractable problem for fabricating high-performance LSeBs [34] ...
