After this test, the influence of the salt concentration within the electrolyte on the self-discharge of EDLCs was also investigated. In this case, electrolytes with a Pyr 14 BF 4 concentration equal to 0.1 M, 1 M and 2 M have been used. Fig. 3 compares the potential retention of the EDLCs charged at different cell voltages (ranging from 1 V till 3 ...

plate capacitor is not a good choice for such a sensor pattern. Placing a finger near fringing electric fields adds conductive surface area to the capacitive system. The additional charge storage capacity added by the finger is known as finger capacitance, C_F . The capacitance of the sensor without a finger
