Power Conversion Efficiency at Scale. In small-area lab devices, perovskite PV cells have exceeded almost all thin-film technologies (except III-V technologies) in power conversion efficiency, showing rapid improvements over the past five years. However, high-efficiency devices have not necessarily been stable or possible to fabricate at large scale.

Abstract PbZrO<sub>3</sub> and PbZrO<sub>3</sub>-based thin films as a typical antiferroelectric material have been widely studied for high-density energy storage capacitors. To prepare high-quality PbZrO<sub>3</sub> films by the sol-gel method, it is necessary to fully understand the effects of precursor solution on the microstructure and electrical properties of the films. In this study, the ...

Furthermore, the energy storage density of 5% Al-doped STO film was increased to 19.37 J/cm<sup>3</sup>.

The electric breakdown strength (Eb) is an important factor that determines the practical applications of dielectric materials in electrical energy storage and electronics. However, there is a tradeoff between Eb and the dielectric constant in the dielectrics, and Eb is typically lower than 10 MV/cm. In this work, ferroelectric thin film ...
