A three-phase motor has 100kW real power load at operating at 0.7pf, we need to improve the power factor to 0.96. Let we calculate the required reactive power in kVAR or capacitor bank to be connected across the motor? Here, $PF_1 = 0.7$. $PF_2 = 0.96$. Required capacitor bank = $100 \times \tan(\cos^{-1}(0.7) - \cos^{-1}(0.96)) = 72.85$ kVAR.

This "in-phase" effect can also be represented by a phasor diagram. In the complex domain, resistance is a real number only meaning that there is no "j" or imaginary component. Therefore, as the voltage and current are both in-phase with each other, there will be no phase difference ($\theta = 0$) between them, so the vectors of each quantity are ...

Impedance. The impedance of a circuit is the total effective resistance to the flow of current by a combination of the elements of the circuit.. Symbol: Z Units: Ω The total voltage across all 3 elements (resistors, capacitors and inductors) is written. V_{RLC} . To find this total voltage, we cannot just add the voltages V_R , V_L and V_C .. Because V_L and V_C ...

Three-phase Wye(Y) Connection. Initially, we explored the idea of three-phase power systems by connecting three voltage sources together in what is commonly known as the "Y" (or "star") configuration.. This configuration of voltage sources is characterized by a common connection point joining one side of each source.

Remember that V_p , I_p , V_L , and I_L are all rms values and that θ is the angle of the load impedance or the angle between the phase voltage and the phase current.. A second major advantage of three-phase systems for power distribution is that the three-phase system uses a lesser amount of wire than the single-phase system for the same line ...

The total impedance is not simply the algebraic sum of resistance and inductive reactance. Since the inductive reactance is 90 degrees out of phase with the resistance and, therefore, its maximum values occur at different times, the vector sum must be used to calculate the impedance. This is illustrated in the image on the right.

As the capacitor's reactance is the smallest of the three components, it dominates the equivalent impedance at this frequency.
