On a new installation, capacitor currents should be measured with a true RMS meter and the results compared with the capacitor's rated current I_r : $I_r = \text{KVAR}_r / (\sqrt{3})$ (three phase) = $\text{KVAR}_r / \text{KV}_r$ (single phase) where KVAR_r and KV_r are the capacitor rated values. If the applied voltage is other than rated, then the measured current I_m will ...

In a generated 230 or 460 VAC 3 phase system, you should always measure about the same 230 or 460 volts between any two legs, (unless your supply power factor is way off). All of this applies here in the US. Three-phase in Canada, and much of the rest of the world, operates the same but at lower voltages (190 / 380) and at 50 Hz instead of 60.
