The poor stability of lead (Pb)-free tin (Sn)-based perovskites under only oxygen (O₂) exposure has attracted extensive research, while their stability under simultaneous light and O₂ (light/O₂) exposure is unexplored. Herein, we found that the (NH₂)₂CHSnI₃ (FASnI₃) perovskite degrades more severely when exposed to light/O₂ than only O₂, which ...

In contrast, low solar energy resource is in the east with a regional minimum below 1300 kWh m⁻² in the Sichuan basin, where the largest cloud coverage is found in China (Fig. S1a). The secondary minimum of solar energy resources is in the northeast due to the highest latitude that limits solar insolation. A similar spatial pattern of solar radiation has been ...

Despite remarkable progress in perovskite solar cells (PSCs), the unsatisfying stability strongly interrelated with the defect density remains the main obstacle for commercialization. Herein, a synergetic defect passivation method is judiciously designed that consists of a precursor engineering strategy based on an ionic liquid 1-butylsulfonate-3-methylimidazolium dihydrogen ...

Himin Solar Energy Group signed a strategic cooperation agreement with major investment banks Goldman Sachs and CDH Investment: 2008: US Dupont signed the Statement of Intent on Developing Solar Energy Technologies with the Hong Kong SAR and the Shenzhen Municipal Government. Zhao, C. Y., Lu, W., & Tian, Y. (2010). Heat transfer enhancement for thermal energy storage using metal foams embedded within phase change materials (PCMs).

Thermal energy storage (TES) plays a vital role in solar thermal energy applications in areas such as energy efficient buildings (Tyagi and Buddhi, 2007) and solar thermal power plants (Hoshi et al., 2005), and therefore, it has received significant attention. Similar problems arise for waste heat recovery systems where the waste heat availability and ...

Solar collectors and thermal energy storage components are the two kernel subsystems in solar thermal applications. Solar collectors need to have good optical performance (absorbing as much heat as possible) [3], whilst the thermal storage subsystems require high thermal storage density (small volume and low construction cost), excellent heat transfer rate ...

Although all-inorganic perovskite solar cells (PSCs) have achieved significant progress in recent years, they still fall behind their prototype organic-inorganic counterparts owing to severe energy losses. Therefore, there is considerable interest in further improving the performance of all-inorganic PSCs by synergic optimization of perovskite films and device ...

Despite surpassing the power conversion efficiency (PCE) of many conventional thin-film solar technologies (1-4), perovskite solar cells (PSCs) struggle to achieve long-term stability because of fragile interfaces (5-8). Some contacts degrade under the combination of various environmental stressors, such as humidity, oxygen, temperature ...
