The type of transformer considered in this text (Figure (PageIndex{3})) is based on Faraday's law of induction and is very similar in construction to the apparatus Faraday used to demonstrate magnetic fields could cause currents. The two coils are called the primary and secondary coils. In normal use, the input voltage is placed on the ...

The current flowing in the coil produces a field that expands out of and surrounds the conductor. Energy is stored in that field. When the source voltage goes from peak to zero, the energy stored in the electromagnetic field is converted back to electrical energy in the coil conductors. The energy actually opposes the changes in the source voltage.
