When it comes to connecting your solar panel to an inverter, it's essential to have a charge controller installed in the circuit. The charge controller regulates the amount of current and voltage that flows from the solar panel to the battery.

Installing an Inverter in a 12 Volt Solar System. To add an inverter to a 12 volt solar system, the following steps can be followed: Select an inverter based on the power requirements of the AC devices you want to run. Make sure the inverter can handle the peak power demands of the devices. Connect the inverter to the batteries in the solar system.

Steve, the solar panel output (Voc) has to be a few voltage higher than the inverter operating voltage, and the current should be as required by the inverter and the load. If the inverter wattage is 100 watt, voltage is 12V, then the solar panel can be rated at 16V and  $100/12 = 8.33$  amp

If you use a 48V inverter, you may follow the same steps as above for connecting it to the solar panels. However, the way you wire the solar panels together will vary based on your system's design and the voltage of your panels.

What Ken describes makes sense, although the technology doesn't. Assuming that its 12/2 with a ground Romex wire from the inverter to the panel, just for clarity, you're saying Ken, that these inexpensive half voltage scheme inverters are sending out half the voltage, 60 vac, on the black wire and the other half of, 60 vac, on the white wire and they come together ...
