Dihydrogen (H₂), commonly named "hydrogen", is increasingly recognised as a clean and reliable energy vector for decarbonisation and defossilisation by various sectors. The global hydrogen demand is projected to increase from 70 million tonnes in 2019 to 120 million tonnes by 2024. Hydrogen development should also meet the seventh goal of "affordable and clean energy" of ...

Battery energy storage systems (BESS) are increasingly being considered by water and wastewater utilities to capture the full energy potential of onsite distributed energy resources (DERs) and achieve cost savings. As new BESS technologies emerge, however, questions about applications, economy of scale, cost-benefits, reliability, maintenance, and durability, continue ...
