A Valve Regulated Lead Acid Battery (VRLA) is a type of rechargeable battery that utilizes a unique design to prevent the escape of gases produced during charging. This design helps to eliminate the need for regular maintenance, as the battery does not require the addition of water or electrolyte.

A VRLA battery or Valve Regulated Lead Acid Battery is a sealed battery or maintenance-free battery. This is one type of Lead-acid rechargeable battery. The VRLA Battery does not require stringent ventilation. Also, we can mount the battery in any orientation. The reduced ventilation requirement is an added advantage of VRLA.

A typical setup consists of a large 12-volt battery, a converter that converts Alternating Current (AC) power into Direct Current (DC) power, and another heavy-duty pump attached to the battery. The battery backup sump pump sits slightly higher than the primary pump, as it needs enough pressure to push the water away from your home's foundation.

Direct TPMS systems consist of 5 main parts: the 4 sensors mounted onto the wheel of each tire (usually near the valve stems) and the indicator in the vehicle's computer system. Therefore, when it is time for the vehicle's maintenance, replacing a direct TPMS system will be a bit more costly. There are two types of direct TPMS systems:

A dual backflow preventer check valve is similar to a double check valve. The configuration has two spring-loaded check valves in series and usually does not include shutoff valves. A dual check valve is powerful against back-siphonage and backpressure. However, it is approved only for residential connections.
