Electric double layer capacitor (EDLC) [1, 2] is the electric energy storage system based on charge-discharge process (electrosorption) in an electric double layer on porous electrodes, which are used as memory back-up devices because of their high cycle efficiencies and their long life-cycles. A schematic illustration of EDLC is shown in Fig. 1.

Electrical energy storage systems include supercapacitor energy storage systems (SES), superconducting magnetic energy storage systems (SMES), and thermal energy storage systems. Energy storage, on the other hand, can assist in managing peak demand by storing extra energy during off-peak hours and releasing it during periods of high demand [7].

A supercapacitor, also known as ultracapacitors or electrochemical capacitor, is an energy storage device, which can act as a gap bridging function between batteries and conventional capacitors. Depending on the charge storage mechanism and research and development trends, electrochemical capacitors are classified into three types, namely; (a)
