Lithium-ion battery development is one of the most active contemporary research areas, gaining more attention in recent times, following the increasing importance of energy storage technology. The galvanostatic intermittent titration technique (GITT) has become a crucial method among various electrochemical analyses for battery research.

A battery charger can allow a unidirectional or bidirectional power flow at all power levels. The bidirectional power flow adds to the grid-to-vehicle interaction (G2V) also the vehicle-to-grid (V2G) mode []. This latter technology can bring significant improvement in the overall reliability of the distribution grid, since in case of system failure, peak load demand or ...

SEs fulfil a dual role in solid-state batteries (SSBs), viz. i) being both an ionic conductor and an electronic insulator they ensure the transport of Li-ions between electrodes and ii) they act as a physical barrier (separator) between the electrodes, thus avoiding the shorting of the cell. Over the past few decades, remarkable efforts were dedicated to the development of ...

Energy plays a key role for human development like we use electricity 24 h a day. Without it, we can't imagine even a single moment. Batteries are perhaps the most prevalent and oldest forms of energy storage technology in human history. 4 Nonetheless, it was not until 1749 that the term "battery" was coined by Benjamin Franklin to describe several capacitors (known as Leyden jars, after the town in which it was discovered), connected in series. The term "battery" was presumably chosen ...
