

Where can I repair lead-acid batteries in Phnom Penh

Diagnosing faults in a lead-acid battery can be done by performing tests such as the open circuit voltage test, the load test, and the internal resistance test. If the battery fails any of these tests, it may need to be replaced. Other signs of a faulty battery include slow cranking, dimming headlights, and a battery that is hot to the touch. ...

Test show that a healthy lead acid battery can be charged at up to 1.5C as long as the current is moderated towards a full charge when the battery reaches about 2.3V/cell (14.0V with 6 cells). Charge acceptance is highest when ...

Recharge the battery and test it again. If a cell is still faulty, it probably has been damaged by sulfation. The cause, low specific gravity of the electrolyte, converts lead and sulfuric acid into hard, lead-sulfate crystals. ...

This occurs when a lead acid battery is deeply discharged, causing sulfur from the battery acid to adhere to the lead plates inside the battery and block the flow of electric current. The sulfur also corrodes the lead plates, but as long as the ...

Typical 12 volt lead-acid car batteries can be discharged to about 9 volts and be recharged, so you're in the clear. Discharging a lead-acid car battery below 9 volts reduces the battery's capacity but it doesn't cause explosion or anything dangerous like that. Cars pull hundreds of amps and their batteries aren't exploding.

Sulfation can be reversed in a flooded lead acid battery if it is detected early enough. You can do this by applying an overcharge to a fully charged battery using a regulated current of around 200mA (milliAmps) for a period of roughly 24 hours. This allows the battery's terminal voltage to rise between 2.50 and 2.66 volts per cell, which helps ...
