It has a depolarizing effect. In a cathodic reaction, manganese is changed from + 4 to + 3 states. $\text{Zn}(\text{NH}_3)_4^{2+}$ is created when the ammonia molecules created at the cathode interact with Zn^{2+} ions coming from the anode. The interaction of NH_3 molecules with Zn^{2+} reduces the amount of free Zn^{2+} and raises the voltage of the cell. The potential of a dry cell ...
