Battery bank wiring matters. It matters how a battery bank is wired into the system. When wiring a battery bank, it is easy to make a mistake. One of the most common mistakes is to parallel all the batteries together and then connect one side of the parallel battery bank to the electrical installation. As indicated in the image on the right.

These units are designed to provide backup power in the event of a main power failure. They typically consist of a battery, a charger, and a control circuit. The battery stores the electrical energy, while the charger keeps the battery charged. The control circuit regulates the operation of the emergency lighting unit. Emergency Lights

To reset the BMS, find the silkscreen label RST on the circuit board. The pin next to it needs to be grounded for a second or two. (Short circuit it with a piece of wire to the ground on the board) Voila, microprocessor reboots. As long as the cells are each above 3.0 volts, and reasonably close to each other in voltage, the pack should be fine now.
