It does this through a chemical reaction that shunts lithium ions (lithium atoms that have lost an electron to become positively charged) from one part of the battery to another. When you unplug the power and use your laptop or phone, the battery switches into reverse: the ions move the opposite way and the battery gradually loses its charge.

The lithium-ion battery has a small number of life cycles about 500-1,000 cycles while the LiFePO₄ battery has a large number of life cycles around 1,000-10,000 life cycles. Temperature Lithium iron phosphate battery can withstand high temperature with minimal effect on its electrodes but lithium-ion battery cannot endure high temperature.
