There are two main reasons why dissipation factors can cause capacitor failure. First, if the dissipation factor is too high, the capacitor will overheat and eventually catch fire. Second, if the dissipation factor is too high, the capacitor will lose its ability to hold a charge. This can cause all sorts of problems, including reduced performance and even ...

Ripple current in tantalum capacitors refers to the maximum alternating current (AC) that the capacitor can handle without experiencing degradation in performance or failure. Tantalum capacitors are commonly used in electronic circuits to filter and stabilize voltage. Ripple current is a crucial parameter, especially in applications where the ...

172 B. GOUDSWAARD AND F. J. J. DRIESEN life-test methods of little help in establishing the failure mechanism. A better method is accelerated testing. At higher stress levels the failure rate increases and the test results lend themselves to more objective analysis. Catastrophic failure rates show a dependence on applied voltage, temperature and series impedance. ...

6.1 Capacitor failure due to mechanical stress. The most pitted failure of ceramic capacitors is short-circuit. Once the ceramic capacitor is short-circuited, the product cannot be used normally, and the harm is very large. So what is the cause of the short-circuit failure? The solution is that mechanical stress will induce cracks, which will lower capacitance ...

AICtech capacitors are designed and manufactured under strict quality control and safety standards.
